competitive pricing

AN INTEGRATED SUPPLY CHAIN

A BRIDGE FROM SOUTH TO NORTH

Jacha Inti

Bolivian quinoa washing and cleaning plant
Handles 22% of Bolivia's quinoa exports
Employees: 180

U.S. Quinoa Processing and Packing Facility
Employees: 45

IMPACT AT ORIGIN:

Inclusion of otherwise marginalized smallholder farmers:

824 traditional smallholder organic farms

Each with an average of 10 hectares: 8,240 ha. under cultivation produce **9 million lbs of organic quinoa**

After keeping enough for their own nutrition, farmers can sell their organic quinoa at a premium of 13% over market prices, providing them income to live dignified lives

LONG LIVE QUINOA

Sustainable Agriculture in the highland desert of the Andes

The highest quality of quinoa has been cultivated for millennia on some of the most marginal and fragile agricultural lands in the world.

At the shores of the salt flats in the Bolivian High Andean Plateau, at some 12,000 feet of altitude, farmers must cope with drought, frost, high winds and less than 8 inches per year of rainfall. Soils are sandy, saline and low in organic matter. Despite this, in 2018 Bolivian smallholder farmers harvested 55,000 tons of quinoa, 25% of the world's supply.

THE COST OF RISING PROSPERITY

Family Income
Per Month

In the past 10 years, Bolivian exports of quinoa have tripled to 30,000 tons per year. This boom increased the incomes of farmers from an average of USD 35 per family per month to USD 350.

But while increasing demand has lifted small-holder quinoa farmers out of poverty, it has also brought a new set of environmental pressures. Mass production is degrading soil health and resistance to wind erosion. This negatively impacts the quality and yields of quinoa production, threatening farmers' livelihoods.

A PROMINENT MARKET FORCE

By promoting sustainable organic farming, Bolivia-based Andean Naturals is counteracting this development. A certified Benefit Corporation (B Corp) founded in 2004, it is certified to the highest food safety and fair trade standards. It is the leading source of quinoa, sourcing from 824 smallholder organic quinoa farmers in 41 associations and 91 villages.

SOIL HEALTH PROGRAM

Andean Naturals' 3-year long project addresses the issue of wind erosion and soil fertility currently affecting quinoa production in the Bolivian High Andean Plateau. It focuses on controlling both the physical aspects of wind erosion (reducing wind speed at ground levels) and improving the soil resistance to wind, as well as on building quinoa producers' capacity on sustainable farming practices via compost application and training.

KEY SUCCESS METRICS

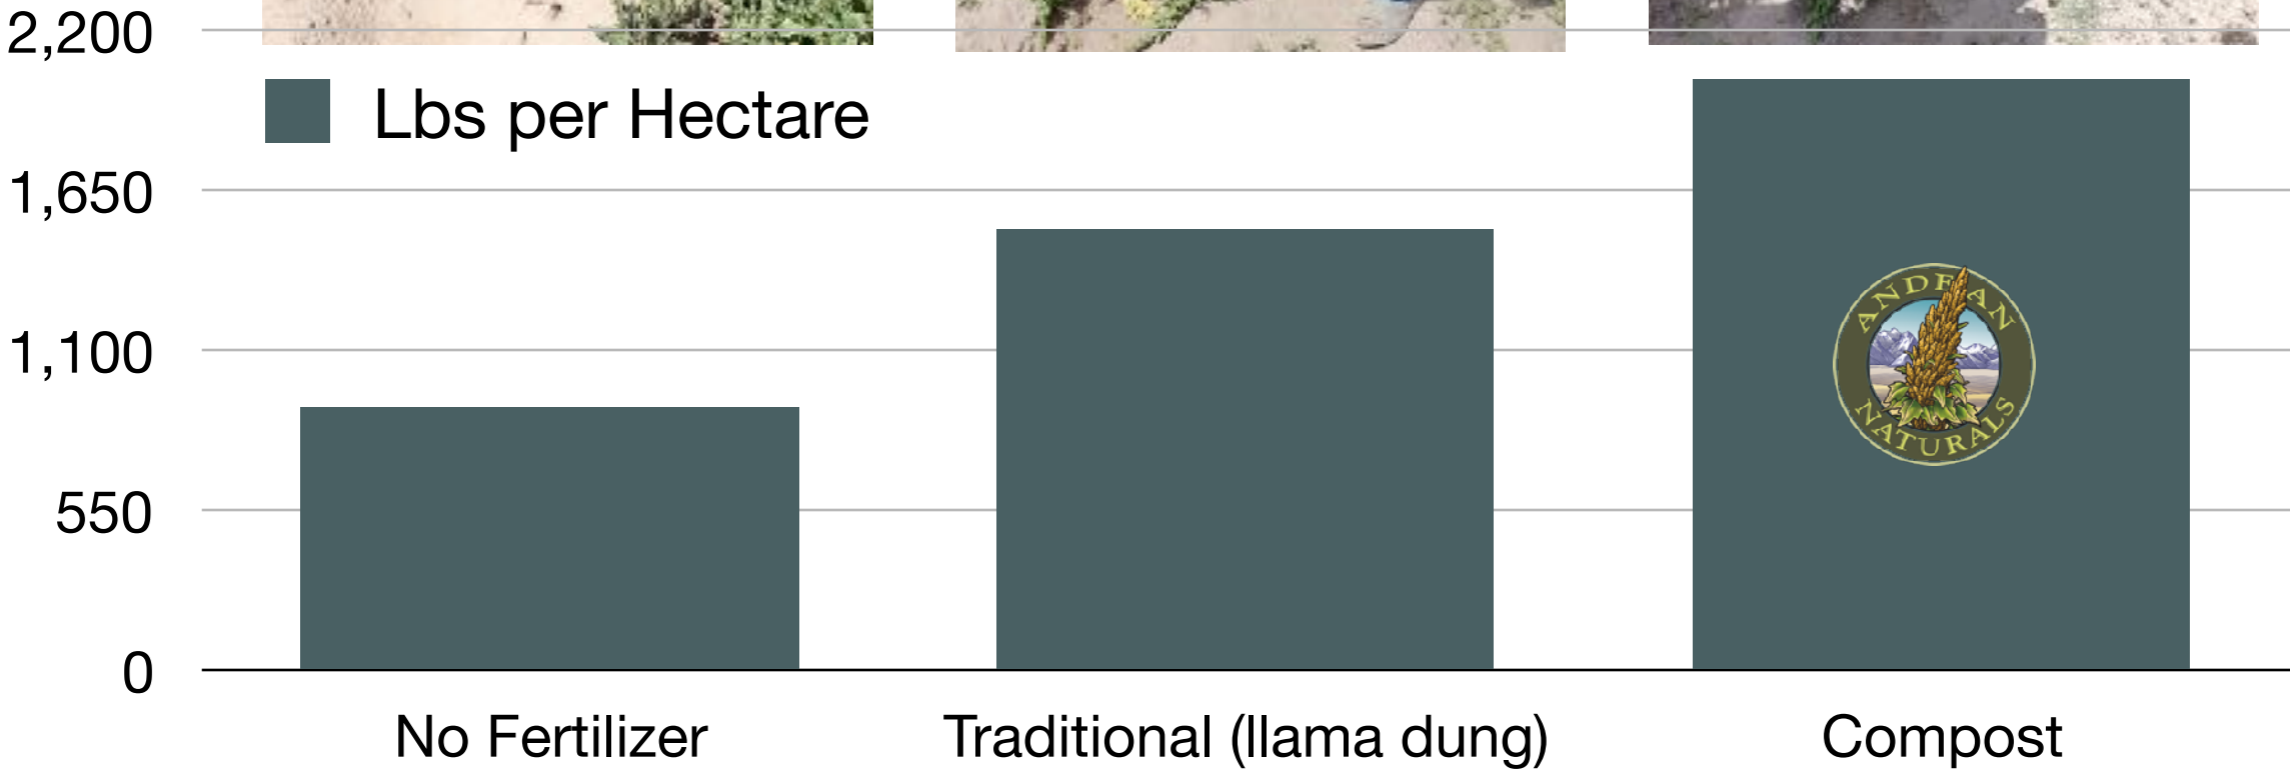

In addition to the improved soil health and ensuring the sustainability of quinoa production in the region, the 3-year project is expected to improve yields by 83%, almost double farmer's incomes and make smallholder farmers in this region competitive at a global scale.

Key Impact Metrics for 3-Year Project on Demonstrative Farms	Year 1	Total for Years (1-3)
Number of demonstrative farms	85	337
Total number of people impacted by the project	434	1,719
Hectares of "demonstrative" land protected with compost, windbreakers (wild sage brush) or wild legumes (lupine) as a rotational crop	227	907
Pounds of additional quinoa produced yearly (increase of 750 lbs per hectare on average) on "demonstrative" hectares	170,250	680,250
Increased monthly income per farm (on top of a base of \$361) with improved farming practices	\$360.00	

FIRST YEAR RESULTS:

IMPACT OF IMPROVED COMPOST FERTILIZER ON YIELDS IN DEMO FIELDS

In photos: Farmer Josué Camata had 2.2 times more quinoa than with the traditional “no fertilizer” practice, and 33% more than the plots that had llama dung alone.
